1. Cut a piece Appli-Web about 1/4" larger than label. Using a Teflon or parchment pressing sheet to protect your iron and pressing surface, place label in between sheets with web backing on wrong side of the label and press with a medium temperature (no steam) and firm pressure. Hold the iron in place for several seconds until bond is achieved.

2. After the piece has cooled, peel away from the Teflon or parchment sheet and cut away the excess web around the label.

3. Once the label is in place, use your iron to press and set the bond. Appli-Web is a permanent bond so feel free not to stitch label in place, if desired.
